GlobalMed®

7 Things Hospital CIOs CMIOs Should Consider

1 Telemedicine solutions should be cost-effective and **easily integrate** into your electronic health record system.

2 Your telemedicine solution should be able to **scale care management resources**, allowing you to look beyond hospitals to other facilities such as skilled nursing facilities.

3 Implementation should not create resentment with your clinical staff. Look for vendors that offer training to help you manage change and **engage your clinicians.**

4 Your Health Information Management system should have the ability to **link patient data and medical images** with case management data.

5 In this era of data breaches, your telemedicine system should include **encryption** that has been validated or certified leading standards, such as: HIPAA High Trust, HITECH and FIPS 140-2.

6 Your telemedicine system should be subscription-based and in the **cloud** so that it is an operating expense and doesn't impinge upon your capital budget.

7 Your telemedicine system should be "future proofed" with **proven technology** that provides a competitive advantage.
